Commonly asked Questions

(1) What is contextual selector?

Contextual selector lets you select a specific occurrence of an element. It is a set of individual selectors in CSS which is separated by white space, a search pattern, where only the last element in the pattern is addressed providing it matches the specified context.

It's a bit complex to understand. So let's take an example :

TD P PARA {color: green}

The element PARA will be displayed in green. However, it would be the case only if it is in the element P which must in the context of the element TD.

(2) What is CSS rule 'at-rule'?

CSS has two
types of
rules:

(a) ruleset
and (b) at-
rule.

at-rule : at-
rule is a rule
that applies
to the whole
style sheet;
which is not
to a specific selector only; like the case of ruleset. It begins with the "@" symbol followed by a keyword contain letters a-z, A-Z, digits 0-9, dashes and escaped characters, for example : @import or @font-face.

(3)　Can you add comments within your CSS code or file?

Yes, CSS can have comments inserted to make code more programmer friendly. Comments can be written between /* <insert your comments> */

(4) Define and explain : what is CSS opacity and transparency? How it works?

You can use "opacity" property to make the original image displayed transparent / semi–transparent on your web page.

I have an example as to how you can use the property :

```
<style>
img {
opacity: 0.5;
filter: alpha(opacity=50); /* For IE8 and earlier */
}
</style>
```

(5) What are some tools I can use to troubleshoot my CSS on the front-end?

You can use Chrome debugger console / toolbar, Firebug add-on in firefox, Charles proxy debugger or Fiddler to troubleshoot CSS on your webpage. These tools allow you to make changes on the fly in real-time to see what is the impact.

Also take a look at **our real-time editor** that works with both CSS, JavaScript / HTML.
